

Street Spraying Equipment

This **purpose modified All Terrain Vehicle** which has been **road registered** and is transported to/from site by its own dedicated vehicle, is used for such purposes as weed control along footpaths and gutter edges for local governments.

This unit and spray system, when **operated by a Chemcert Accredited** operator, has proven itself over time to be the most efficient way to safely spray weeds, in very built up urban areas, that grow on footpaths and in gutters edges. The ATV has the ability to drive up and down gutters and other slopes and to effectively manoeuvre around street obstacles such as parked cars.

The unit can also efficiently spray fence lines and is used at such facilities as oil refineries, commercial and industrial sites where other vehicles are too big to safely move around the site installations.

The spray unit has a 70 litre capacity and is driven by an electric pump. The operator has the use of a hand gun and a 30 meter hose to get into areas that even an ATV can't squeeze in to, such as small alley ways and stairways up/down access ways between buildings. The operator also carries a hand spray unit for very narrow path ways.
